

## Landscape designing: **protecting economy, environment, lifestyle...**

### Introduction:

Landscape designing is perhaps one of the most important professions in the world. If you do not protect the architecture of the fast-changing landscapes around the world, soon you will see highways, railroads lined with endless blocks of cement; blocks of tedium. The way the expanse of housing, industry, forestry, and agriculture is growing these days, it is burying our natural landscape. A well-designed landscape; therefore, is the key to protecting the economy, the environment, and our overall lifestyle.

### The need:

In the growing clutter of industrial and residential complexes around the world, it is important that we create landscape designs that allow us to merge these structures with natural surroundings as much possible; creating a sense of place.

A good landscape and architectural design will help us avoid the feeling that the buildings have just dropped on the ground from the sky... these designs in fact will bring these cold, cement and steel structures to life.

If we are planting evergreens for privacy, creating breath-taking outdoor architectures for entertaining, building corporate hubs to run businesses, or install a swimming pool, the efforts should be to ensure that our customers and family alike enjoy every aspect of the property. This is possible only through good landscape designs.

The more in-tune we are in terms of what our customers and family want, the better equipped we will be to create the project they desire. And while these objectives can be achieved only through a well-designed landscape, importantly, it will help us keep in mind that the structure is part of--not separate from--the property itself.
